max	77.529759	6.315280

Mean:

The mean height is approximately 67.99 inches. The mean weight is approximately 127.08 pounds. Standard Deviation (Std):

The standard deviation for height is approximately 1.90 inches, indicating the spread or dispersion of heights around the mean. The standard deviation for weight is approximately 11.66 pounds, indicating the spread or dispersion of weights around the mean. Minimum and Maximum Values:

The minimum height recorded is approximately 60.28 inches, and the maximum height is approximately 75.15 inches. The minimum weight recorded is approximately 78.01 pounds, and the maximum weight is approximately 170.92 pounds. Percentiles (25th, 50th, and 75th):

The 25th percentile (Q1) indicates that 25% of the data falls below a height of approximately 66.70 inches and a weight of approximately 119.31 pounds. The 50th percentile (median) indicates that 50% of the data falls below a height of approximately 67.99 inches and a weight of approximately 127.16 pounds. The 75th percentile (Q3) indicates that 75% of the data falls below a height of approximately 69.27 inches and a weight of approximately 134.89 pounds.

Hyperparameter Tuning

In [44]:

```
from sklearn.model_selection import GridSearchCV
from sklearn.linear_model import LinearRegression

# Define hyperparameters to tune
param_grid = {
    'fit_intercept': [True, False],
    'copy_X': [True, False]
}
```

```python
# Create a Linear Regression model
model_lr = LinearRegression()

# Initialize GridSearchCV
grid_search = GridSearchCV(model_lr, param_grid, cv=5, scoring='neg_mean_squared_er

# Fit the model
grid_search.fit(X_train_2d, y_train_2d)

# Print the best parameters and best MSE score
print("Best Parameters:", grid_search.best_params_)
print("Best Negative MSE Score:", grid_search.best_score_)
```

```
Best Parameters: {'copy_X': True, 'fit_intercept': True}
Best Negative MSE Score: -20.836260216566203
```

Final Model

In [45]:

```python
from sklearn.linear_model import LinearRegression

# Initialize the Linear Regression model with the best parameters
final_model = LinearRegression(fit_intercept=False, copy_X=True)

# Fit the model to the entire training data
final_model.fit(X_train_2d, y_train_2d)

# Now you can use final_model to make predictions on new data
```
